# What is the (binary) heap?

- The (binary) heap data structure is an array object that can be viewed as a nearly complete binary tree. Each node of the tree corresponds to an element of the array that stores the value in the node.
- An array  $A$  that represents a heap is an object with two attributes:
  - $\text{length}[A]$  is the number of elements in the array
  - $\text{heap-size}[A]$  is the number of elements in the heap stored within array  $A$ .

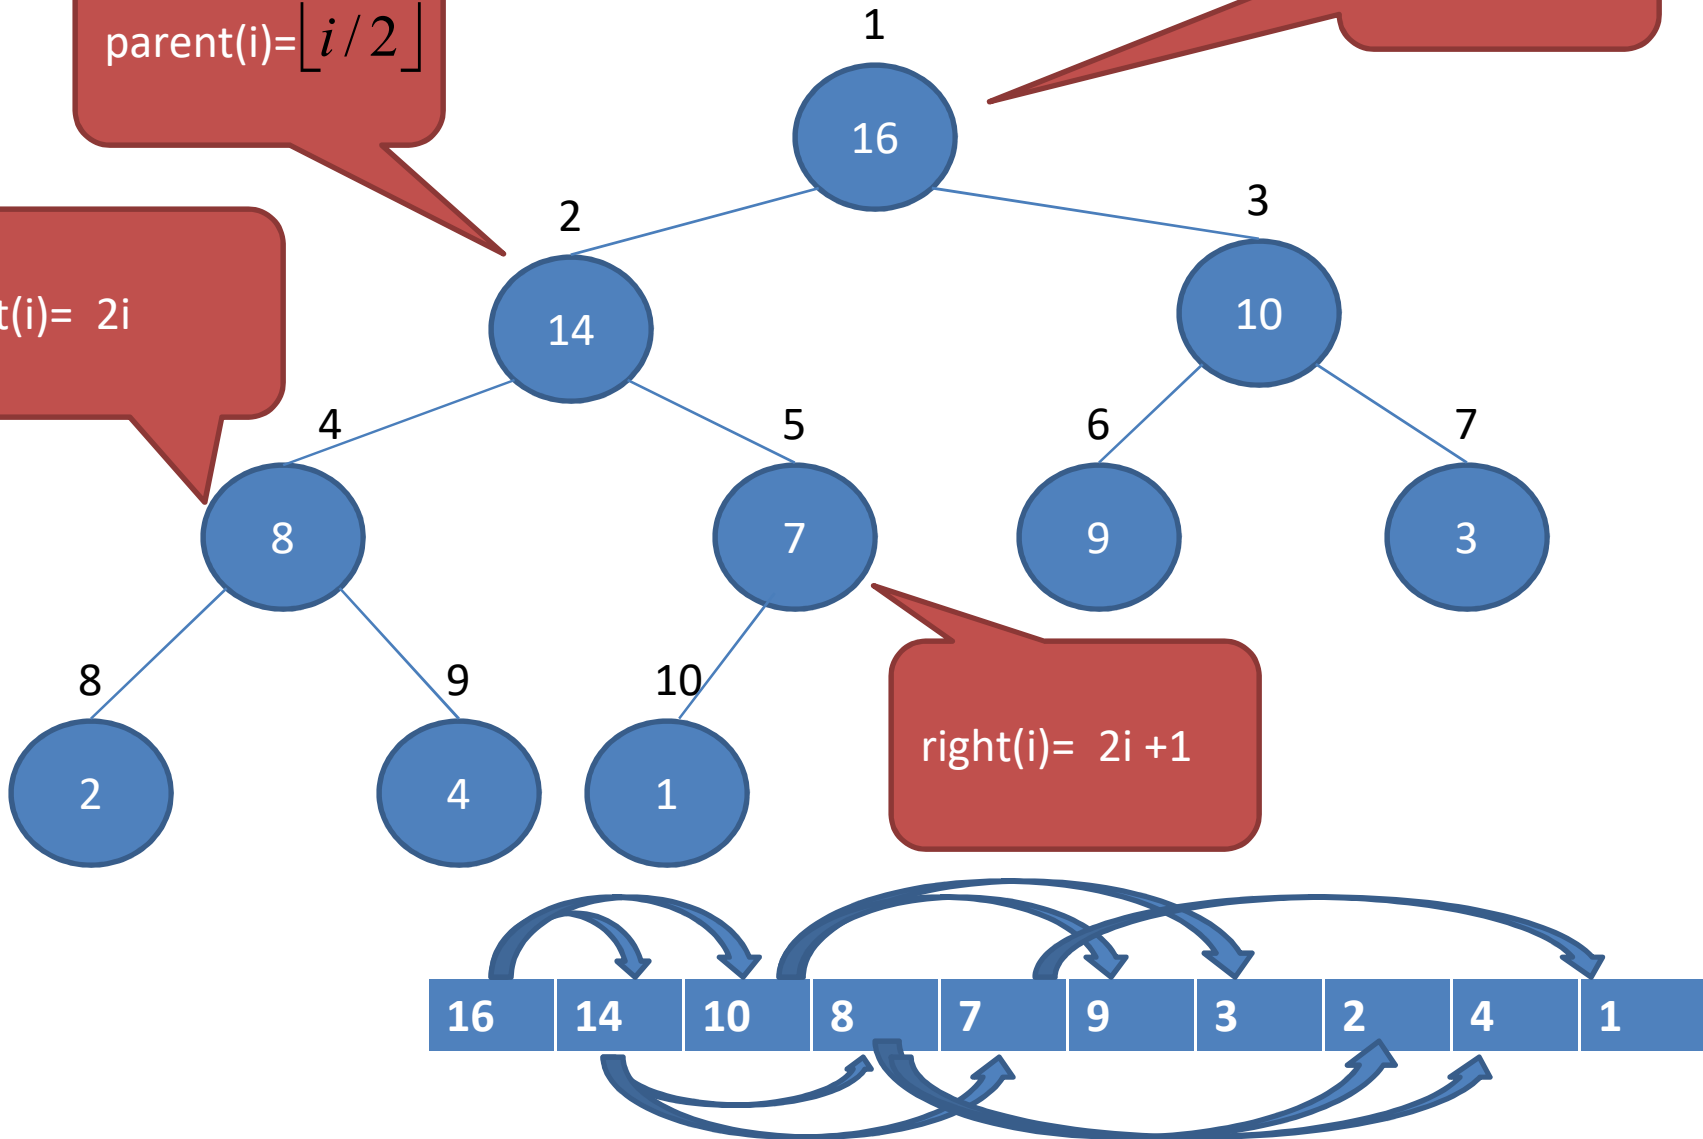

# Example: heap

Root is A[1]

$$\text{parent}(i) = \lfloor i/2 \rfloor$$

$$\text{left}(i) = 2i$$

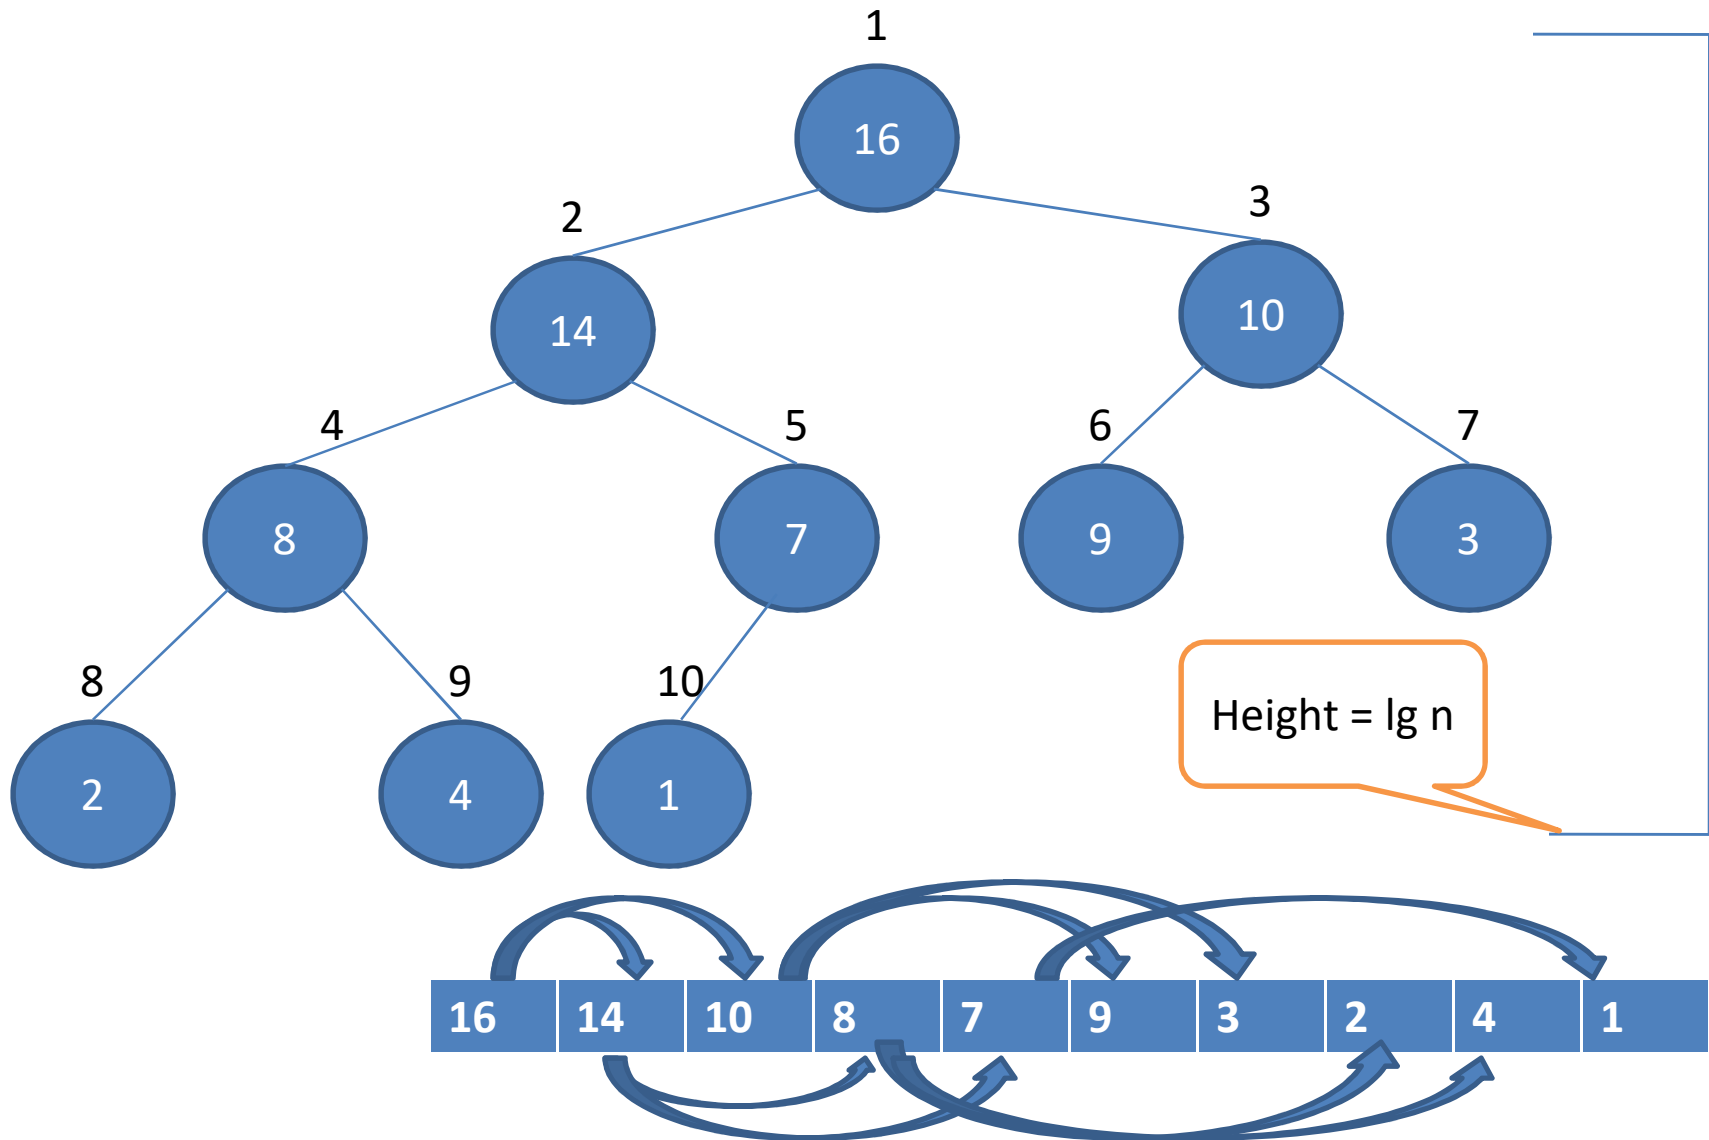

$$\text{right}(i) = 2i + 1$$

# Binary Heap

- There are two kinds of binary heaps:
- Max-heaps
  - For every node  $i$  other than the root,  
 $A[\text{parent}(i)] \geq A[i]$
- Min-heaps
  - For every node  $i$  other than the root,  
 $A[\text{parent}(i)] \leq A[i]$

# Example: Max-heap

# Max-Heapify(A,i)

l = left(i)

r = right(i)

if  $l \leq \text{heap-size}[A]$  and  $A[l] > A[i]$

    then largest = l

else largest = i

if  $r \leq \text{heap-size}[A]$  and  $A[r] > A[\text{largest}]$

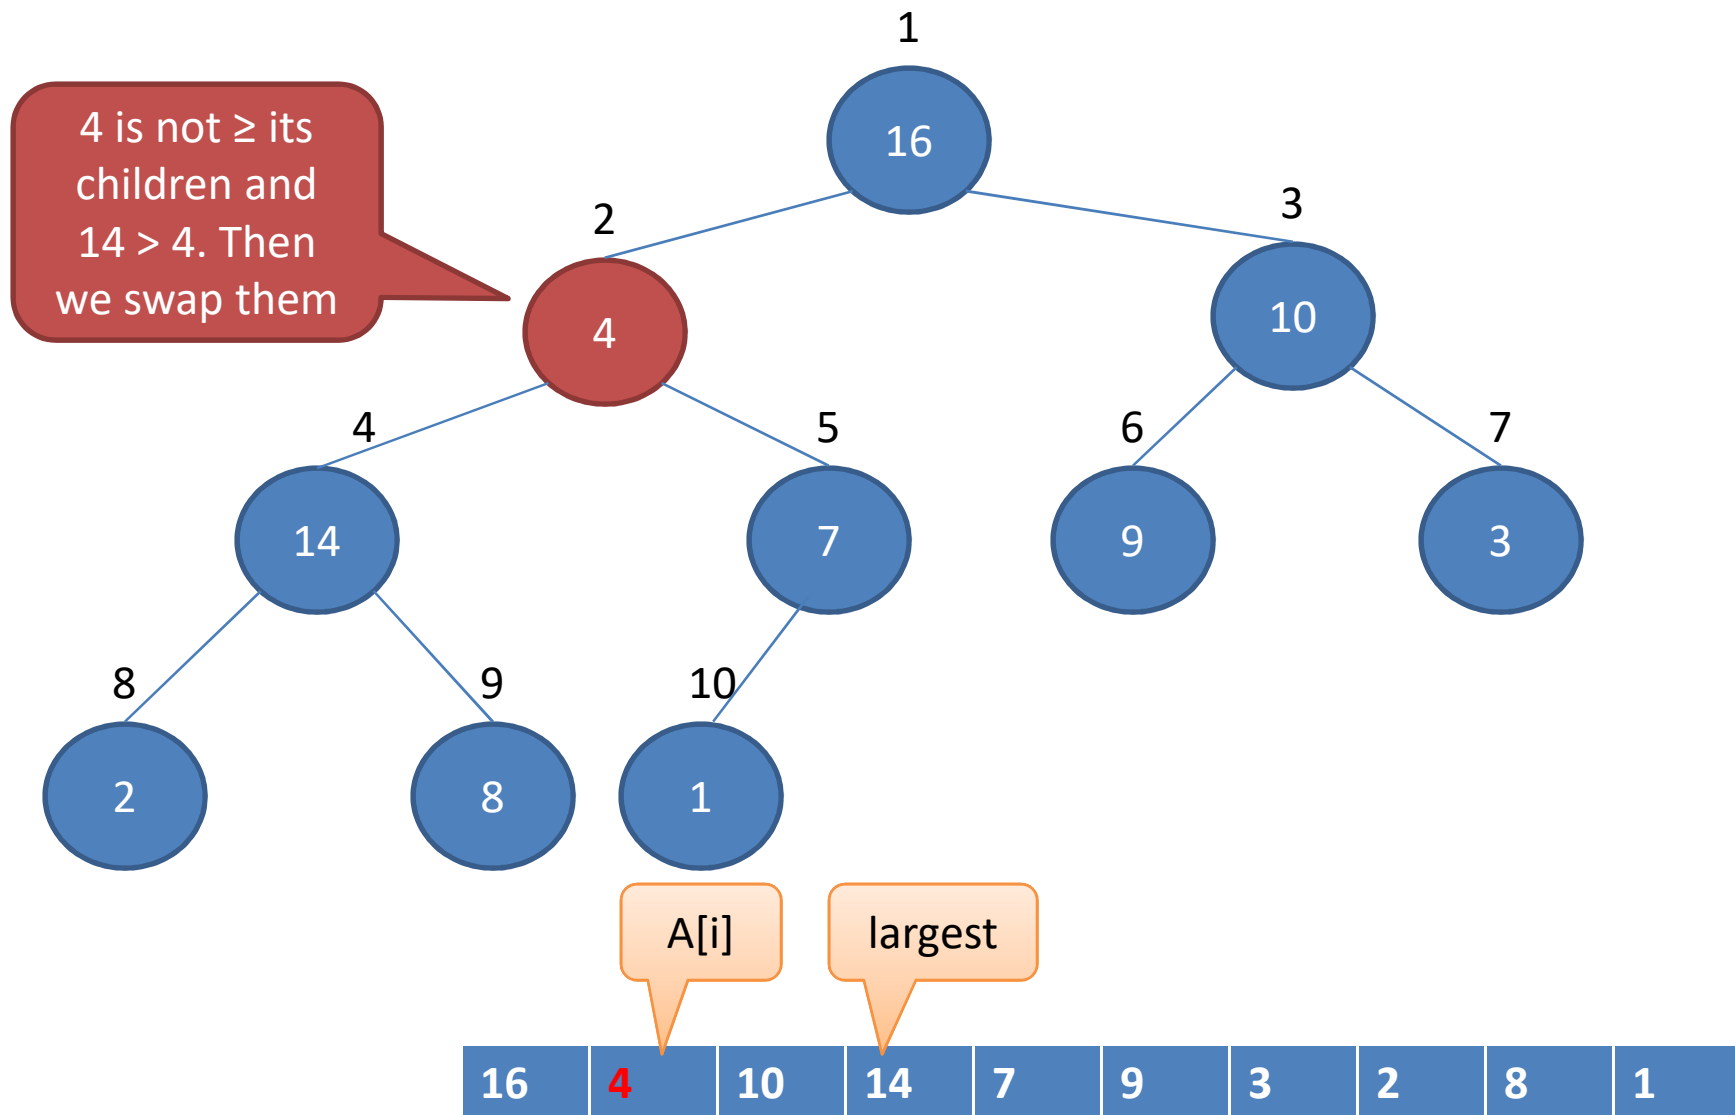

    then largest = r

If largest  $\neq$  i

    then exchanged A[i] and A[largest]

    Max-Heapify(A,largest)

# Example: Max-Heapify(A,2)

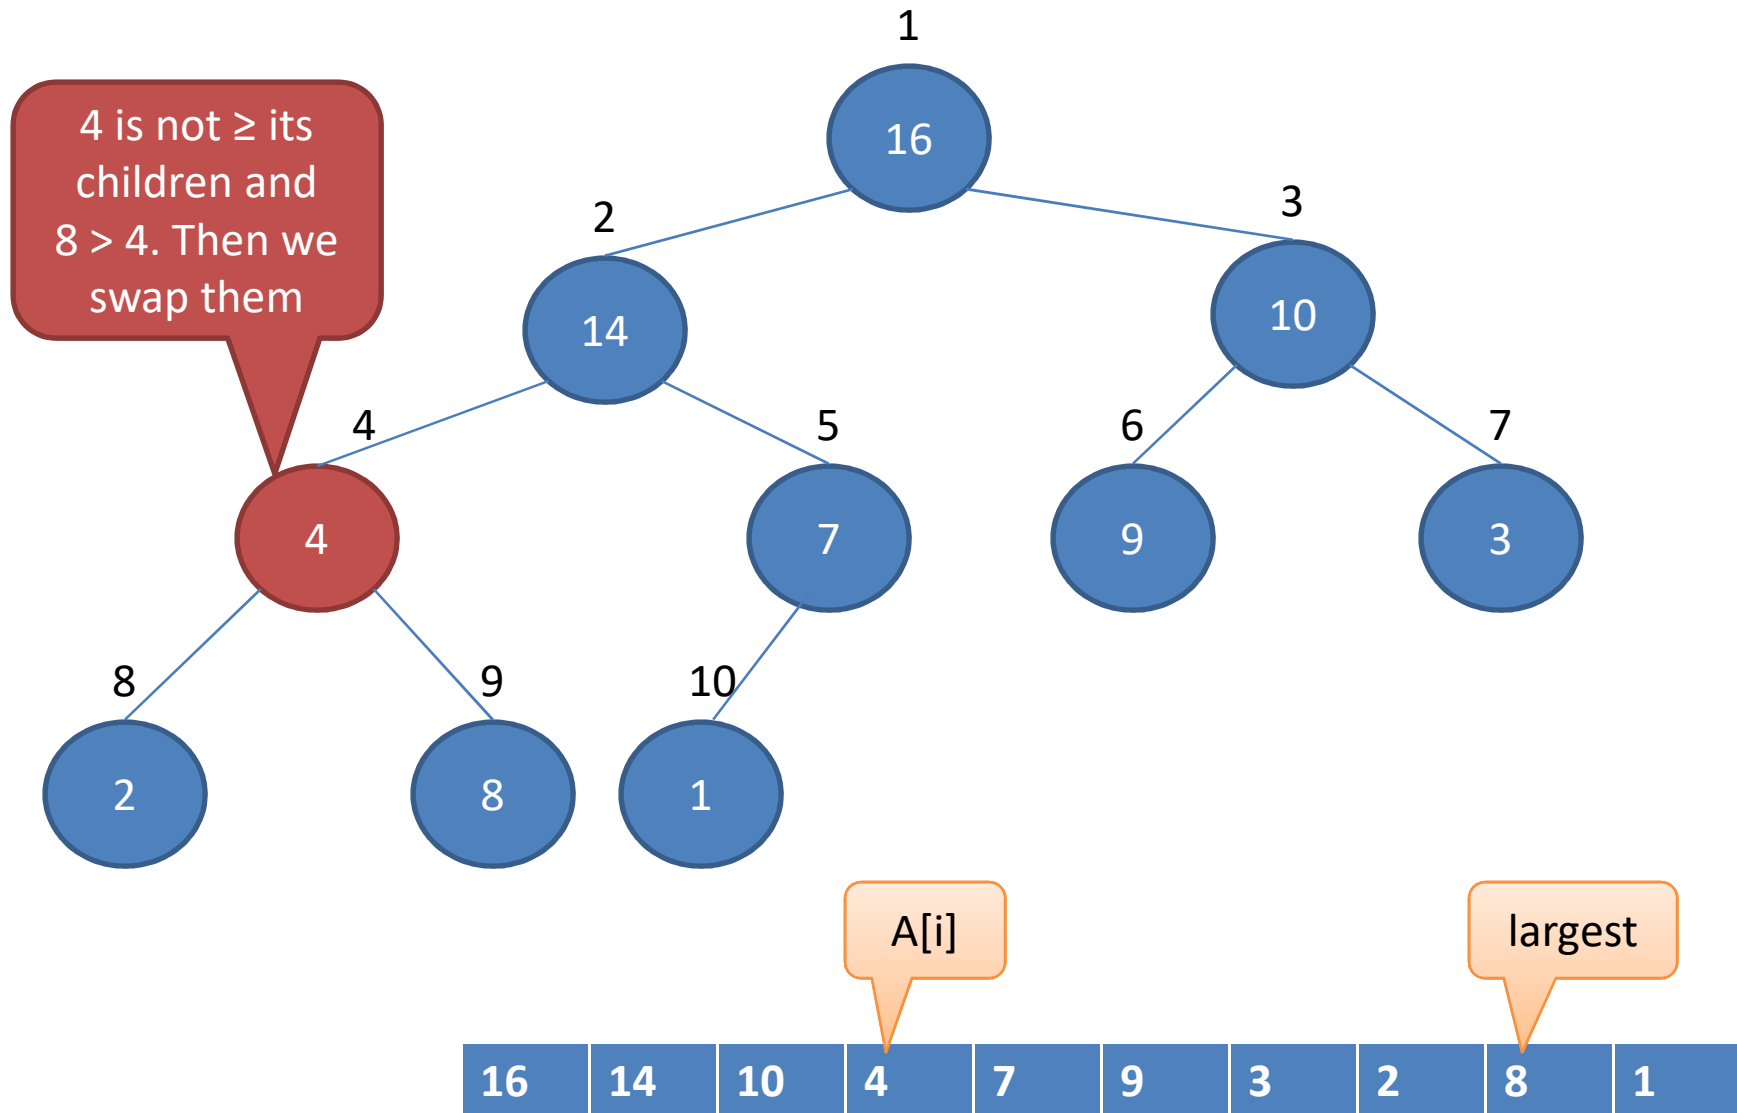

# Example: Max-Heapify(A,2)

16	14	10	4	7	9	3	2	8	1
----	----	----	---	---	---	---	---	---	---

# Example: Max-Heapify(A,4)

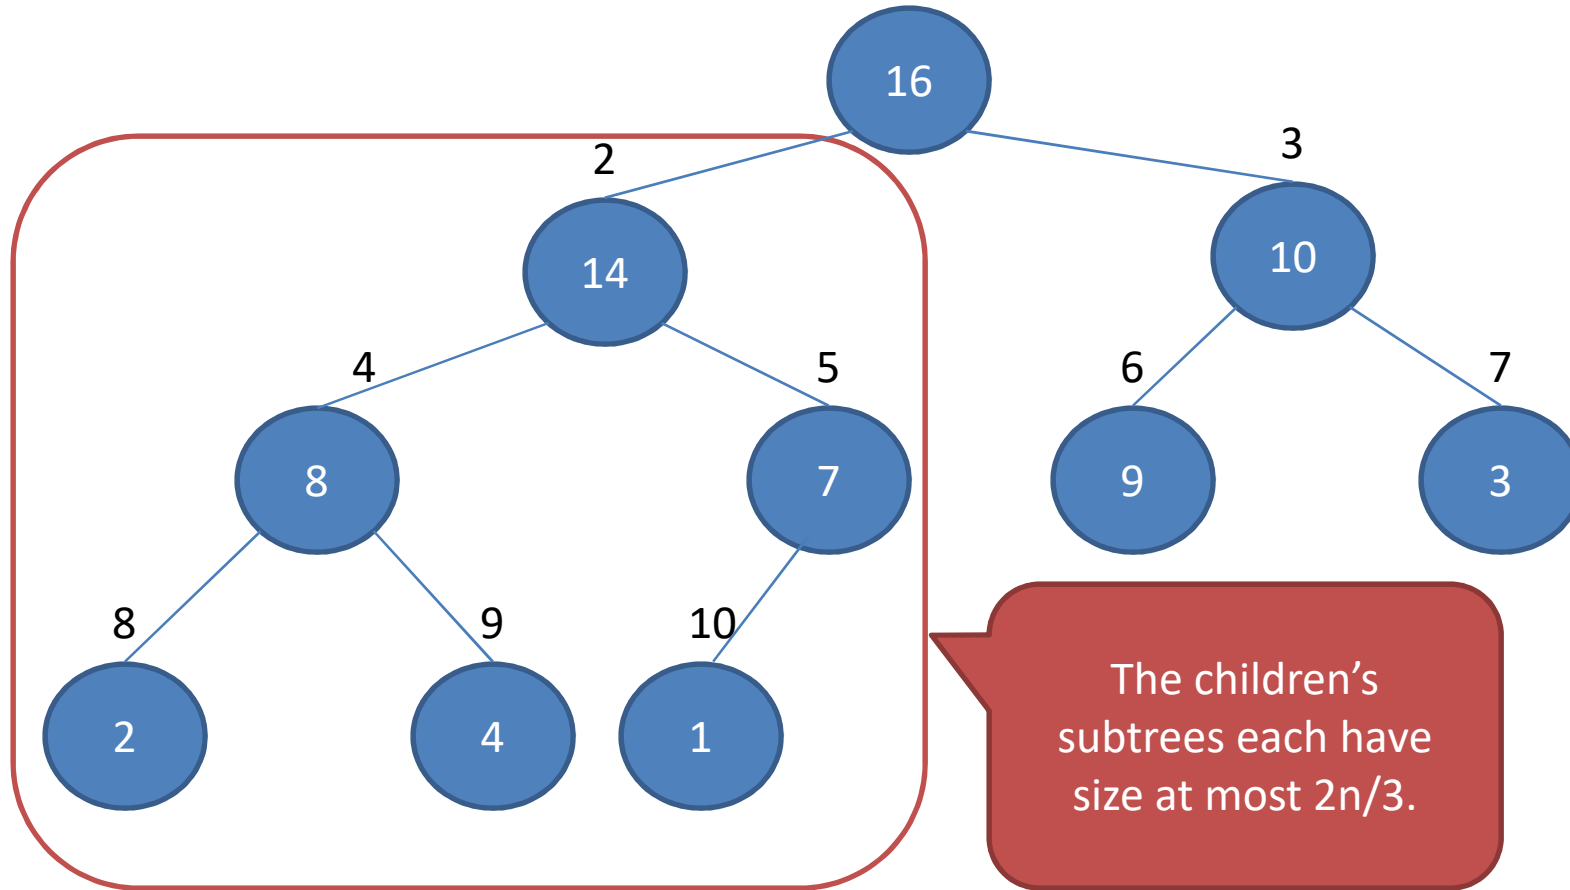

# Example: Max-Heapify(A,4)

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

# Analyze: Running time of Max-Heapify(A,i)

$$T(n) \leq T(2n/3) + \Theta(1)$$

# Analyze: Running time of Max-Heapify(A,i)

- We have  $T(n) = T(2n/3) + 1$
- Determine which case of the master theorem applies:
- We have  $a=1, b=3/2, f(n)= 1$
- Thus we have  $n^{\log_b a} = n^{\log_{3/2} 1} = n^0 = 1$
- Since  $f(n) = \Theta(n^0) = \Theta(1)$  we can apply case 2 of the master theorem and conclude that the solution is  $T(n) = \Theta(n^{\log_b a} \lg n) = \Theta(\lg n)$

ข้อสังเกต  $1 = n^0$ , case 2

# Build-Max-Heap(A)

```
heap-size[A] = length[A]
for i =  $\lfloor \text{length}[A]/2 \rfloor$  downto 1
  do Max-Heapify(A,i)
```

# Example: Build-Max-Heap(A)

4	1	3	2	16	9	10	14	8	7
---	---	---	---	----	---	----	----	---	---

# Example: Build-Max-Heap(A)

4	1	3	2	16	9	10	14	8	7
---	---	---	---	----	---	----	----	---	---

# Example: Build-Max-Heap(A)

4	1	3	14	16	9	10	2	8	7
---	---	---	----	----	---	----	---	---	---

# Example: Build-Max-Heap(A)

4	1	3	14	16	9	10	2	8	7
---	---	---	----	----	---	----	---	---	---

# Example: Build-Max-Heap(A)

4	1	10	14	16	9	3	2	8	7
---	---	----	----	----	---	---	---	---	---

# Example: Build-Max-Heap(A)

4	1	10	14	16	9	3	2	8	7
---	---	----	----	----	---	---	---	---	---

# Example: Build-Max-Heap(A)

4	16	10	14	7	9	3	2	8	1
---	----	----	----	---	---	---	---	---	---

# Example: Build-Max-Heap(A)

4	16	10	14	7	9	3	2	8	1
---	----	----	----	---	---	---	---	---	---

# Example: Build-Max-Heap(A)

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

# Analyze: Build-Max-Heap(A)

```
heap-size[A] = length[A]
for i =  $\lfloor \text{length}[A]/2 \rfloor$  downto 1
    do Max-Heapify(A,i)
```

loop invariant =  
at the start of each iteration of the for loop of lines 2-3, each node  $i+1, i+2, \dots, n$  is the root of a max-heap.

## Initialization:

Before running loop 1,  $i = \lfloor n/2 \rfloor$ . Each node  $\lfloor n/2 \rfloor + 1, \lfloor n/2 \rfloor + 2, \dots, n$  is a leaf and is the root of a trivial max-heap. (True!!)

## Maintenance:

if children of node  $i$  are numbered higher than  $i$ , they are both roots of max-heaps.

The condition required for the call Max-Heapify(A,i) to make node  $i$  a max-heap root.

Decrementing  $i$  in the for loop update reestablishes the loop invariant for the next loop. (True!!)

**Termination:** at termination,  $i = 0$ . each node  $1, 2, \dots, n$  is the root of a max-heap. Node 1 is. (True!!)

# Analyze running time: Build-Max-Heap(A)

```
heap-size[A] = length[A]
for i =  $\lfloor \text{length}[A]/2 \rfloor$  downto 1
  do Max-Heapify(A,i)
```

Times

1

$n/2+1$

$n/2 \cdot O(\lg n)$

$$T(n) = O(n \lg n)$$

Tight Analysis: an  $n$ -element heap has height =  $\lceil \lg n \rceil$  and at most  $\lceil n/2^{h+1} \rceil$  nodes of any height  $h$ . The time required by Max-Heapify when called on a node of height  $h$  is  $O(h)$ . Thus running time can be bounded as  $O(n)$

# Heapsort(A)

```
Build-Max-Heap(A)
for i = length[A] downto 2
    do exchange A[1] and A[i]
    heap-size[A] = heap-size[A] - 1
    Max-Heapify(A,1)
```

# Example: Heapsort(A)

# Priority Queues

- A priority queue is a data structure for maintaining a set  $S$  of elements, each with an associated value called a key.
- There are two kinds of priority queues:
- A max priority queue supports these operations:
  - $\text{Insert}(S,x)$  -> inserts the element  $x$  into the set  $S$ .
  - $\text{Maximum}(S)$  -> returns the element of  $S$  with the largest key.
  - $\text{Extract-Max}(S)$  -> removes and returns the element of  $S$  with the largest key.
  - $\text{Increase-Key}(S,x,k)$  -> increases the value of element  $x$ 's key to the new value  $k$  which is assumed to be as large as  $x$ 's current key value.
- A min priority queue supports these operations:
  - $\text{Insert}(S,x)$  ,  $\text{Minimum}(S)$  ,  $\text{Extract-Min}(S)$  ,  $\text{Decrease-Key}(S,x,k)$

# Max-Priority Queue

```
Pseudo-code: Heap-Maximum(A)  
return A[1]
```

Running time =  $O(1)$

# Max-Priority Queue

## **Pseudo-code: Heap-Extract-Max(A)**

if heap-size[A] < 1

    then error “heap underflow”

max=A[1]

A[1] = A[heap-size[A] ]

heap-size[A] = heap-size[A] – 1

Max-Heapify(A,1)

return max

Running time =  $O(\lg n)$

# Max-Priority Queue

**Pseudo-code: Heap-Increase-Key(A,I,Key)**

if  $\text{key} < A[i]$

    then error “new key is smaller than current key”

$A[i] = \text{key}$

while  $i > 1$  and  $A[\text{parent}(i)] < A[i]$

    do exchange  $A[i]$  and  $A[\text{parent}(i)]$

$i = \text{parent}(i)$

Running time =  $O(\lg n)$

# Max-Priority Queue

**Pseudo-code: Max-Heap-Insert(A, key)**

heap-size(A) = heap-size[A]+1

A[heap-size[A]] =  $-\infty$

Heap-Increase-Key(A, heap-size[A], key)

Running time =  $O(\lg n)$

# Example: Max-Priority Queue: Heap-Increase-Key

# Example: Max-Priority Queue: Heap-Increase-Key

# Example: Max-Priority Queue: Heap-Increase-Key

# Example: Max-Priority Queue: Heap-Increase-Key
