

## Depth-First Top-Down Parsing Algorithm

Input: context-free grammar  $G = (N, T, P, S)$

string  $p \in T^*$

Stack  $K$

1.  $PUSH([S, 0], K)$

2. repeat

2.1.  $[q, i] := POP(K)$

2.2.  $dead-end := \text{false}$

2.3. repeat

Let  $q = uAv$  where  $A$  is the leftmost variable in  $q$ .

2.3.1. if  $u$  is not a prefix of  $p$  then  $dead-end := \text{true}$

2.3.2. if there is no  $A$  rule numbered greater than  $i$  then  $dead-end := \text{true}$

2.3.3. if not  $dead-end$  then

    Let  $A \rightarrow w$  be the first  $A$  rule with number greater than  $i$  and

    let  $j$  be the number of this rule

        2.3.3.1.  $PUSH([q, j], K)$

        2.3.3.2.  $q := uwv$

        2.3.3.3.  $i := 0$

    end if

until  $dead-end$  or  $q \in T^*$

until  $q = p$  or  $EMPTY(K)$

3. if  $q = p$  then accept else reject
